

DIESEL POWER ICE TANK

Break the ice with Diesel Power Ice!

The requirement to increase the use of Biodiesel introduced by the new European Community legislation on the environmental impact, has improved the quality of emissions in diesel engines, but at the expense of resistance to freezing of the diesel fuel, due to the increased presence of water particles that the mono-alkyl ester (vegetable oil or animal fat) components of Biodiesel tend to form in the reservoirs and cisterns.

The resulting problem of the decrease in CFPP (Cold Filter Plugging Point) is the temperature point: water particles and the paraffin inside the diesel filter begin to crystallize clogging the fuel flow and shutting off the motor. This is becoming, more and more, a frequent occurrence.

Magigas has developed a specific additive to counter this problem: the Diesel Power ICE TANK. Thanks to the formula of special antifreeze and anti-caking agents, ICE TANK improves the resistance of diesel fuel at low temperatures by increasing the CFPP.

One bottle is sufficient for every 500 litres of diesel fuel.

The function of the antifreeze and de-icing components make starting the engine easier as well as the anti-lock fuel pump. It is ideal for cold climates with below zero temperatures.

Increases the CFPP by 10°/12° C.

Superformula DIESEL POWER ICE TANK is sold in 500 ml bottles.
